DATE MAILED: 11/03/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/360,934

Applicant(s)

COVACCI ET AL.

Examiner

S. Devi, Ph.D.

Art Unit

1645

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
 - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
 - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
 - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 11 August 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 40,54,61-65,72-75,82-86,93 and 94 ~~is/are~~ are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 40,54,61-65,72-75,82-86,93 and 94 ~~is/are~~ are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Request for Continued Examination

1) A request for continued examination under 37 C.F.R 1.114, including the fee set forth in 37 C.F.R 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 C.F.R 1.114, and the fee set forth in 37 C.F.R 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 C.F.R 1.114. Applicants' submission filed on 08/11/04 has been entered.

Applicants' Amendment

2) Acknowledgment is made of Applicants' amendment filed 08/11/04 in response to the final Office Action mailed 02/25/04. With this, Applicants have amended the specification.

Status of Claims

3) Claims 40, 63, 74 and 84 have been amended via the amendment filed 08/11/04.
Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 are pending and are under examination.

Prior Citation of Title 35 Sections

4) The text of those sections of Title 35 U.S. Code not included in this action can be found in a prior Office Action.

Prior Citation of References

5) The references cited or used as prior art in support of one or more rejections in the instant Office Action and not included on an attached form PTO-892 or form PTO-1449 have been previously cited and made of record.

Rejection(s) Withdrawn

6) The rejection of claims 40, 74 and 84 made in paragraph 17(c) of the Office Action mailed 06/09/03 and maintained in paragraph 23 of the Office Action mailed 02/25/04 under 35 U.S.C. § 112, second paragraph, as being indefinite, is withdrawn in light of Applicants' amendments to the claims.

7) The rejection of claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 made in paragraph 18 of the Office Action mailed 06/09/03 and maintained in paragraph 24 of the Office Action mailed 02/25/04 under 35 U.S.C. § 112, first paragraph, as containing new matter, is withdrawn in light of Applicants' amendments to the claims and/or the base claims.

8) The rejection of claims 40, 54, 61-65, 72-75, 82-85, 93 and 94 made in paragraph 19 of the Office Action mailed 06/09/03 and maintained in paragraph 25 of the Office Action mailed 02/25/04

under 35 U.S.C § 112, first paragraph, as containing inadequate written description, is withdrawn.

9) The rejection of claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 made in paragraph 20 of the Office Action mailed 06/09/03 and maintained in paragraph 26 of the Office Action mailed 02/25/04 under 35 U.S.C. § 102(e) as being anticipated by Cover *et al.* (US 6,054,132, filed 02/26/1992 - already of record), is withdrawn in light of Applicants' amendment to the claims and/or the base claims. A modified rejection is made below to meet the limitations in the claims, as amended.

10) The rejection of claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 made in paragraph 21 of the Office Action mailed 06/09/03 and maintained in paragraph 27 of the Office Action mailed 02/25/04 under 35 U.S.C. § 102(b) as being anticipated by Cover *et al.* (*J. Biol. Chem.* 267: 10570-10575, 25 May 1992 - Applicants' IDS) (Cover *et al.*, 1992), is withdrawn in light of Applicants' amendment to the claims and/or the base claims. A modified rejection is made below to meet the limitations in the claims, as amended.

Rejection(s) Maintained

11) The provisional rejection of claims 40, 54, 63-65, 74, 75, 84 and 85 made in paragraph 10 of the Office Action mailed 06/09/03 and maintained in paragraph 22 of the Office Action mailed 02/25/04 under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 38, 44, 45 and 46 of the co-pending application SN 09/921,157, is still maintained for reasons set forth therein. Applicants have assured the Office that they would submit a terminal disclaimer over SN 09/921,157 upon the receipt of an indication of allowability.

Response to Applicants' Arguments on the New Matter Rejection

12) Applicants contend that they disclose polypeptides of SEQ ID NO: 3 which when used as immunogens elicit antibodies in animals that also recognize the native cytotoxic protein of *Helicobacter pylori*. Applicants state that they are not claiming that the native protein is non-cytotoxic, but that the polypeptides of the invention (useful as immunogens) are non-cytotoxic or have reduced cytotoxicity. Applicants submit that the claim includes the feature that the polypeptides of the invention are immunologically identifiable by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3, i.e., 'the same antibodies recognize the polypeptides as recognize the native protein having the amino acid of SEQ ID NO: 3' and that the polypeptides exhibit no toxicity or reduced cytotoxicity. Applicants submit that the specification at lines 21-30 of page 14 teaches the polypeptides of the invention which consist of at

least 3-5 amino acids, and more preferably at least 8-10 amino acids, and even more preferably at least 11-15 amino acids, or which is immunologically identifiable with a polypeptide encoded in the [designated] sequence'. Applicants further state that the originally filed claims and the specification at page 4, lines 1-4, amended to include the language of the originally filed claim 8, specify that the polypeptides of the invention 'exhibit substantially no toxicity or substantially reduced toxicity'.

Applicants' arguments have been carefully considered, but are not persuasive. Contrary to Applicants' contention, the polypeptides of the invention, which are useful as immunogens and which have 'no cytotoxicity' or 'reduced cytotoxicity', do not have descriptive support in the specification, as originally filed. A polypeptide having the amino acid sequence of SEQ ID NO: 3 which has cytotoxic activity and which causes vacuolation and death of a number of eukaryotic cell types has descriptive support in the instant specification, for example, at lines 31-39 on page 5 of the specification. The specification at lines 21-30 of page 14 describes a polypeptide which consists of at least 3-5 amino acids, and more preferably at least 8-10 amino acids, and even more preferably at least 11-15 amino acids, **or** a polypeptide which is immunologically identifiable with a polypeptide encoded in the sequence'. Nothing in this part of the specification associates the polypeptide or portions thereof with 'no cytotoxic activity or reduced cytotoxic activity'. The original claim 8 is not supportive of a recombinant polypeptide comprising at least fifteen, ten or five contiguous amino acids from the amino acid sequence of SEQ ID NO: 3, having the two *required* functional properties of: (a) immunological identifiability by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3 *and*, (b) no cytotoxic activity or reduced cytotoxic activity.

Response to Applicants' Arguments on Cover *et al.* ('132 and 1992)

13) I. The patent of Cover *et al.* ('132):

With regard to Cover *et al.* ('132), Applicants state that Cover *et al.* ('132) disclosed the purification of a cytotoxin of *Helicobacter pylori* with vacuolating activity. Applicants contend that at lines 7-9 of column 2, Cover *et al.* ('132) state that 'an' object of their invention is to provide a substantially pure antigenic composition with vacuolating toxin activity, and that one embodiment of the invention is a purified antigenic composition with vacuolating toxin activity. Applicants point to lines 37-39 in column 2 of Cover *et al.* ('132) and state that the CB antigen is defined as the 'functionally active non-denatured vacuolating toxin'. Applicants submit that Cover *et al.* ('132) do

not teach or suggest the use of portions of the cytotoxin that exhibit substantially no, or substantially reduced cytotoxicity as claimed in the instant application. Applicants state that the Office's position that Cover's patent '132 teaches a 23 amino acid fragment of the CB antigen which comprises the antigenic polypeptide is incorrect, because the Patentees performed N-terminal sequencing of a purified toxin to deduce the amino acid composition and sequence of the N-terminus of the toxin. Applicants assert that this portion was not used as an immunogen, rather was performed to partially characterize the entire CB toxin. Applicants submit that Cover *et al.* ('132) (I) did not obtain and purify a 23 amino acid fragment from the toxin, and that such is neither the purpose nor the result of N-terminal sequencing. With this, Applicants conclude that Cover *et al.* ('132) (I) do not teach every element of the claims and does not anticipate the claims within the meaning of 35 U.S.C. § 102.

Applicants' arguments have been carefully considered, but are non-persuasive. Instant claims do not include the limitations: 'substantially no cytotoxicity', or 'substantially reduced cytotoxicity'. Cover *et al.* ('132) do not have to teach the purified polypeptide or the purified polypeptide fragment, because the instant claims do not require the claimed polypeptide of any length to be purified. Cover *et al.* ('132) did not teach just one object of the invention, but taught more than one embodiment and several objects of their invention. One such embodiment is antigenic fragments of a purified CB antigen. Cover *et al.* ('132) expressly disclosed that the term CB antigen includes 'antigenic fragments of the holotoxin, whether derived from *H. pylori* or synthetically or **recombinantly** produced' [Emphasis added]. Cover *et al.* ('132) expressly taught that their invention contemplates fragments of proteins having substantial homology to the CB antigen as well as CB antigen analogs (see lines 41-47 in column 2). Cover *et al.* ('132) taught a parenteral *H. pylori* vaccine that includes the fragments of the CB protein, which is administered with an adjuvant, or by itself in a suitable buffer (see lines 42-50 in column 16). Via Example 7, Cover *et al.* ('132) taught the antigenic fragment of the CB protein, usable in ELISA, for detection of antibodies to *Helicobacter pylori*. This indicates that the prior art antigenic fragment is immunologically identifiable by antibodies specifically reactive with the native polypeptide. One such antigenic fragment is depicted as the 23 amino acid-long sequence at the top of Table 2 in columns 11 and 12. Cover's ('132) Sequence Listing in columns 17 and 18 depicts the structure of this 23 amino acid sequence construct as, Ala Phe Phe Thr The Val Ile Ile Pro Ala Ile Val Gly Gly

Ile Ala Thr Gly Thr Ala Val Gly Thr, which is structurally identical to the polypeptide fragment located at positions 34-56 of the instantly recited amino acid sequence of SEQ ID NO: 3. Cover's ('132) 23 amino acid-long antigenic fragment is long enough to serve as an immunogen or antigen, since it is well known in the art that the smallest peptides which elicit antibodies that bind to the original full length protein are six amino acids in length. See the first sentence under 'Size of the Peptide' on page 76 of Harlow *et al.* Because of the 100% sequence or structural identity between the instantly recited polypeptide comprising at least 5, 10, or 15 contiguous amino acid fragment and the prior art protein fragment of 23 contiguous amino acids, the prior art protein fragment is viewed as structurally the same as the instantly claimed polypeptide of the recited length, and therefore is expected to have the same functional properties of the instantly claimed protein fragment, i.e., the immunological identifiability by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3; and the non-cytotoxicity or the reduced cytotoxicity. The immunological identifiability by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3; and the property of non-cytotoxicity or reduced cytotoxicity are viewed as the inherent functional properties inseparable from the prior art protein fragment. Furthermore, from the fact that the fully cytotoxic polypeptide of SEQ ID NO: 3 is 1296 amino acids in length and that Cover's ('132) N-terminal antigenic fragment, Ala Phe Phe Thr The Val Ile Ile Pro Ala Ile Val Gly Gly Ile Ala Thr Gly Thr Ala Val Gly Thr, amounts only to 23 contiguous amino acids of this large cytotoxic polypeptide, it is reasonable to conclude that the structurally identical Cover's ('132) 23 amino acid-long N-terminal antigenic fragment is minimally of reduced cytotoxicity, if not of no cytotoxicity, compared to the full length cytotoxic polypeptide of SEQ ID NO: 3. Such a less cytotoxic 23 amino acid-long fragment of SEQ ID NO: 3 meets the claimed polypeptide comprising 'at least ten', 'at least fifteen' and 'at least five' contiguous amino acids from SEQ ID NO: 3.

II. The reference of Cover *et al.* (1992):

Applicants provide the priority status of the instant application and assert that Cover *et al.* (1992) was published 25 May 1992, two months after the Applicants' priority date for the Italian application and less than one year prior to the PCT applications. Applicants state that they have fully addressed the new matter rejection, and are thereby entitled to the earliest claim of priority, and that Cover *et al.* (1992) do not qualify as prior art under 35 U.S.C. § 102(b).

With regard to the teachings of Cover *et al.* (1992), Applicants state that Cover *et al.* (1992) teach the purification to homogeneity of a vacuolating cytotoxin from *Helicobacter pylori*, and that one step in evaluating the purified protein in Cover *et al.* (1992) was to perform N-terminal amino acid sequencing to determine the amino acid sequence of the first 23 amino acids. Applicants submit that Cover *et al.* (1992) did not purify a fragment of the cytotoxin comprising 23 amino acids. Applicants state that amino acid sequencing breaks the peptide bond of the N-terminal amino acid and analyzes it, and subsequently the next amino acid is cleaved from the peptide chain. With this, Applicants conclude that Cover *et al.* (1992) does not include every limitation of the claims and does not anticipate the claims within the meaning of 35 U.S.C. § 102.

Applicants' arguments have been carefully considered, but are not persuasive. The prior application PCT/EP93/00472 was filed 03/02/93, and the application PCT/EP93/00158 was filed 01/25/93. The foreign priority application, FI 92A000052 was filed 03/02/92. None of these prior applications contain descriptive support for the newly added limitations: 'no cytotoxic activity or reduced cytotoxic activity', and/or for a recombinant polypeptide comprising at least fifteen, ten or five contiguous amino acids from the amino acid sequence of SEQ ID NO: 3, and having the two *required* functional properties of: (a) immunological identifiability by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3 *and*, (b) no cytotoxic activity or reduced cytotoxic activity. The foreign priority application, FI 92A000052, does not even appear to describe a polypeptide of the amino acid sequence SEQ ID NO: 3. Therefore, the reference of Cover *et al.* *J. Biol. Chem.* 267: 10570-10575, published 25 May 1992, is properly applied as prior art under 35 U.S.C. § 102(b).

Applicants are invited to point to specific pages and/or lines of the foreign priority application, FI 92A000052, that describes the full or partial structure of 'SEQ ID NO: 3'.

The reference of Cover *et al.* (1992) does not have to teach a purified 23 amino acid fragment of the cytotoxin, because none of the instant claims include the limitation 'purified', or require the claimed polypeptide to be 'purified'.

It is important to note that Cover's ('132 or 1992) 23 amino acid-long antigenic polypeptide fragment is not excluded from the scope of the claimed invention. It should be further noted that Applicants have never denied that Cover's ('132 or 1992) 23 amino acid-long polypeptide is not structurally the same as the polypeptide fragment located at positions 34-56 of the instantly recited

amino acid sequence of SEQ ID NO: 3. In fact, all through the instant specification, Applicants have acknowledged Cover's ('1992) disclosure of this 23 amino acid polypeptide. This is *prima facie* evidence that this polypeptide fragment taught by Cover (1992) was already known in the art at the time of the invention. For example, in the first part of page 6 of the specification, Applicants cite the reference of Cover *et al.* (1992) and state that 'the previously described 87 kDa results from either the further processing of the 100 kDa protein or from proteolytic degradation of a larger protein during purification'. See also lines 27-30 on page 47 of the specification. The fourth full paragraph on page 45 of Applicants' specification acknowledges that the amino acid fragment encoded by the nucleotides 116-413 of the sequence shown in Figure 1 (i.e., SEQ ID NO: 2) and fused to a part of the MS2 polypeptide includes 'the 23 amino acids previously identified'. The instant specification at lines 10-14 of page 47 readily admits that this 23 amino acid-long sequence is identified as 'the amino terminus of the previously described 87 kDa vacuolating protein, ... J. Biol. Chem. 267: 10570-75 (1992)'. Therefore, by Applicants' own admission what is claimed in the instant claims encompasses the previously described Cover's (1992) 23 amino acid-long sequence of the 87 kDa polypeptide, including the one that has been completely neutralized. See the art rejection below.

Rejection(s) under 35 U.S.C. § 112, First Paragraph (New Matter)

14) Claims 40, 63, 74, 84 and those dependent therefrom are rejected under 35 U.S.C. § 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor, at the time the application was filed, had possession of the claimed invention. This is a new matter rejection.

Claims 40, 63, 74 and 84 include the new limitations: exhibits 'no cytotoxic activity or reduced cytotoxic activity'. Accordingly, the claims are now drawn to a recombinant polypeptide comprising at least fifteen, ten or five contiguous amino acids from the amino acid sequence of SEQ ID NO: 3, which polypeptide is *required* to have *two* functional properties: (a) immunological identifiability by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3 *and*, (b) exhibits no cytotoxic activity or reduced cytotoxic activity. Applicants appear to point to lines 35-39 of page 5 of the specification as providing descriptive support for the new limitations. However, this part of the specification, or the rest of the specification as originally filed, or the original claim 8, does not provide descriptive support for the

newly added limitations: 'no cytotoxic activity or reduced cytotoxic activity', and/or for a recombinant polypeptide comprising at least fifteen, ten or five contiguous amino acids from the amino acid sequence of SEQ ID NO: 3, and having the two *required* functional properties of: (a) immunological identifiability by antibodies that react specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3 *and*, (b) no cytotoxic activity or reduced cytotoxic activity. Instead, the paragraph bridging pages 5 and 6 of the specification, as originally filed, provides descriptive support for a *H. pylori* cytotoxin 'having cytotoxic activity' which 'cytotoxin causes vacuolation and death of a number of eukaryotic cell types'. Because of the open claim language 'comprising', the instant claims encompass a *H. pylori* polypeptide having the amino acid sequence of SEQ ID NO: 3 and a molecular weight of at least 87 kDa or 100 kDa. These polypeptides having these molecular weights are however described as having 'cytotoxic activity', as opposed to having 'no cytotoxic activity' or 'reduced cytotoxic activity', in the paragraph bridging pages 5 and 6 of the instant specification. Claims also encompass at least five-, ten-, or fifteen amino acid-long fragments of the polypeptide of SEQ ID NO: 3 having the two recited required functions/properties. However, such fragments having the two recited properties do not have descriptive support in the specification as originally filed. Therefore, the limitations in the claims are considered to be new matter. *In re Rasmussen*, 650 F2d 1212 (CCPA, 1981). New matter includes not only the addition of wholly unsupported subject matter but also, adding specific percentages or compounds after a broader original disclosure, or even omission of a step from a method. See M.P.E.P 608.04 to 608.04(c).

Applicants are respectfully requested to remove the new matter from the claim(s), or point to specific pages and line numbers in the specification, as originally filed, where support for such recitations can be found.

15) Claims 61, 62, 72, 73, 82, 83, 93 and 94, and those dependent therefrom are rejected under 35 U.S.C § 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. This is a new matter rejection.

Instant claims include the limitation: 'at least' 87 kDa or 'at least' 100 kDa. However, there appears to be no descriptive support within the specification, as originally filed, for a recombinant

polypeptide comprising the amino acid sequence of SEQ ID NO: 3, as recited, wherein the polypeptide has a molecular weight of 'at least' 87 kDa or 'at least' 100 kDa. The term 'at least 80 kDa' or 'at least 100 kDa' encompasses any kDa that is more than 87 or 100 kDa. The term 'at least' has no upper limit and causes the claims to encompass literally any embodiment outside the '85 kDa' or '100 kDa'. Therefore, the new limitations in the instant claims are considered to be new matter. *In re Rasmussen*, 650 F2d 1212 (CCPA, 1981). New matter includes not only the addition of wholly unsupported subject matter but also, adding specific percentages or compounds after a broader original disclosure, or even omission of a step from a method. See M.P.E.P. 608.04 to 608.04(c).

Applicants are invited to point to specific line and page numbers of the specification, as originally filed, that provide descriptive support for the claimed invention identified above, or to remove the new matter from the claims.

Rejection(s) under 35 U.S.C. § 112, Second Paragraph

16) Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite, for failing to particularly point out and distinctly claim the subject matter which Applicants regard as the invention.

(a) Claims 40, 63, 74 and 84 are vague and indefinite in the recitation: 'reduced cytotoxic activity', because it is unclear what degree of cytotoxicity is encompassed in this limitation. The term 'reduced' is a relative term which renders the claims indefinite. The term 'reduced cytotoxic activity' is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably appraised of the scope of the invention.

(b) Claims 54, 61, 62, 64, 65, 72, 73, 82, 83, 85, 86, 93 and 94, which depend directly or indirectly from claim 40, 63, 74 or 84, are also rejected as being indefinite because of the indefiniteness or vagueness identified above in the base claim.

Rejection(s) under 35 U.S.C. § 102

17) The following is a quotation of the appropriate paragraphs of 35 U.S.C. § 102 that form the basis for the rejections under this section made in this Office Action:

A person shall be entitled to a patent unless –

(e)(2) a patent granted on an application for patent by another filed in the United States before the invention by the Applicant for patent, except that a patent shall not be deemed filed in the United States for the purposes of

this subsection based on the filing of an international application filed under the treaty defined in section 351(a).

18) Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 are rejected under 35 U.S.C. § 102(e)(2) as being anticipated by Cover *et al.* (US 6,054,132, filed 02/26/1992 - already of record) (Cover *et al.*, '132) as evidenced by Harlow *et al.* (*In: Antibodies: A Laboratory Manual*. Cold Spring Harbor Laboratory, Chapter 5, p. 76, 1988).

It is noted that the transitional recitation 'comprising' is open-ended claim language and therefore does not exclude additional, unrecited elements. See MPEP 2111.03 [R-1].

Cover *et al.* ('132) disclosed an antigenic polypeptide of *Helicobacter pylori* which is recombinantly or synthetically produced, and a composition comprising the same (see column 2, lines 25-58). Cover *et al.* ('132) expressly disclosed that the term CB antigen includes 'antigenic fragments of the holotoxin, whether derived from *H. pylori* or synthetically or **recombinantly** produced' [Emphasis added]. Cover *et al.* ('132) expressly taught that their invention contemplates fragments of proteins having substantial homology to the CB antigen as well as CB antigen analogs (see lines 41-47 in column 2). Cover *et al.* ('132) taught a parenteral *H. pylori* vaccine that includes the fragments of the CB protein, which is administered with an adjuvant, or by itself in a suitable buffer (see lines 42-50 in column 16). The antigenic fragment of the CB protein, usable in ELISA, for detection of antibodies to *Helicobacter pylori* is taught by Cover *et al.* ('132) in Example 7. This indicates that the prior art antigenic fragment is immunologically identifiable by antibodies specifically reactive with the native polypeptide. One such fragment is depicted as the 23 amino acid-long sequence at the top of Table 2 in columns 11 and 12. Cover's ('132) Sequence Listing in columns 17 and 18 depicts the structure of this 23 amino acid sequence construct as, Ala Phe Phe Thr The Val Ile Ile Pro Ala Ile Val Gly Gly Ile Ala Thr Gly Thr Ala Val Gly Thr, which is 100% structurally identical to the polypeptide fragment located at positions 34-56 of the instantly recited amino acid sequence of SEQ ID NO: 3. The antigenic polypeptide is present along with water, phosphate buffered saline or an adjuvant (see column 18, third paragraph; column 17, second paragraph; and column 16, lines 45-50). The polypeptide has a molecular weight of 87,000 or 972,000 (i.e., at least 87 or 100 kDa) Daltons. See column 2, seventh full paragraph. Given that the structural elements of the instant claims are met by the prior art antigenic protein fragment, the immunological identifiability by antibodies specifically reactive with the amino acid sequence of

SEQ ID NO: 3 and the exhibition of no cytotoxicity or reduced cytotoxicity, are viewed as the inherent or intrinsic properties inseparable from the antigenic polypeptide taught by Cover *et al.* ('132). Furthermore, from the fact that the fully cytotoxic polypeptide of SEQ ID NO: 3 is 1296 amino acids in length and that Cover's ('132) N-terminal antigenic fragment, Ala Phe Phe Thr The Val Ile Ile Pro Ala Ile Val Gly Gly Ile Ala Thr Gly Thr Ala Val Gly Thr, amounts only to 23 contiguous amino acids of this large cytotoxic polypeptide, it is reasonable to conclude that the structurally identical Cover's ('132) 23 amino acid-long N-terminal antigenic fragment is, minimally, of reduced cytotoxicity, if not of no cytotoxicity, compared to the full length cytotoxic polypeptide of SEQ ID NO: 3. Such a less cytotoxic 23 amino acid-long fragment of SEQ ID NO: 3 meets the claimed polypeptide comprising 'at least ten', 'at least fifteen' and 'at least five' contiguous amino acids from SEQ ID NO: 3 that is of reduced cytotoxicity. Cover's ('132) 23 amino acid-long antigenic fragment is long enough to serve inherently as an immunogen since it is well known in the art that the smallest peptides which elicit antibodies that bind to the original full length protein are 6 amino acids in length. See the first sentence under 'Size of the Peptide' on page 76 of Harlow *et al.*

Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 are anticipated by Cover *et al.* ('132). The reference of Harlow *et al.* is not used as a secondary reference in combination with Cover *et al.* ('132), but rather is used to show that every element of the claimed subject matter is disclosed by Cover *et al.* ('132) with the unrecited limitation(s) being inherent in view of what is known in the art as explained above. See *In re Samour* 197 USPQ 1 (CCPA 1978).

19) Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 are rejected under 35 U.S.C. § 102(b) as being anticipated by Cover *et al.* (*J. Biol. Chem.* 267: 10570-10575, 25 May 1992 – already of record) (Cover *et al.*, 1992) as evidenced by Harlow *et al.* (*In: Antibodies: A Laboratory Manual*. Cold Spring Harbor Laboratory, Chapter 5, p. 76, 1988).

Instant claims are not afforded the priority benefit to PCT applications, PCT/EP93/00472 filed 03/02/93 and PCT/EP93/00472 filed 03/02/93, or to the foreign priority application, FI 92A000052 filed 03/02/92, since these applications lack descriptive support for the newly added limitations: 'no cytotoxic activity or reduced cytotoxic activity', and/or for a polypeptide or recombinantly produced polypeptide comprising the amino acid sequence of SEQ ID NO: 3, having the two *required* functional properties of: (a) immunological identifiability by antibodies that react

specifically with the polypeptide having the amino acid sequence of SEQ ID NO: 3 *and*, (b) no cytotoxic activity or reduced cytotoxic activity.

Instant claims are interpreted in this rejection as encompassing a polypeptide comprising an at least five, ten or fifteen amino acid-long fragment of the amino acid sequence of SEQ ID NO: 3, wherein the polypeptide exhibits no cytotoxic activity or reduced cytotoxic activity and immunological identifiability by antibodies that react specifically with *H. pylori* cytotoxin. It is noted that the transitional recitation 'comprising' represents open-ended claim language and therefore does not exclude additional, unrecited elements. See MPEP 2111.03 [R-1].

Cover *et al.* (1992) taught the culture supernatants comprising an amount of *Helicobacter pylori* vacuolating toxin (i.e., polypeptide) having a molecular weight of 87,000, 100,000 or 972,000 daltons wherein the toxin's vacuolating activity is completely neutralized, i.e., rendered non-cytotoxic or less cytotoxic. The protein is reactive (i.e., immunologically identifiable) with an antiserum raised against the purified *Helicobacter pylori* protein of a molecular weight of 87,000 (see paragraph bridging pages 10572 and 10573; page 10571, left column; and the one bridging pages 10573 and 10574). That the polypeptide comprised in the prior art culture supernatants is intrinsically immunogenic is inherent from the teachings of Cover *et al.* (1992). It is important to note that the completely neutralized Cover's (1992) *Helicobacter pylori* vacuolating toxin (i.e., polypeptide) comprises an amino terminal portion having the sequence, AFFTTVIIPAIVGGIATGTAVGT, which amino terminal sequence has 100% sequence identity with a 23 amino acid-long contiguous polypeptide fragment that stretches between positions 34-56 of the instantly recited SEQ ID NO: 3 (see the very first sequence depicted at the top portion of Cover's Table III). Because the prior art polypeptide has the same molecular weight of 87,000 or 100,000 as the instantly claimed polypeptide, the 100% structural identity with an N-terminal portion of the instantly recited amino acid sequence of SEQ ID NO: 3, the immunological identifiability by an antiserum that reacts with the *Helicobacter pylori* vacuolating toxin of molecular weight 87,000, and the reduced or no cytotoxic activity, it is reasonably considered that there is sufficient overlap between the prior art *Helicobacter pylori* polypeptide and the instantly recited polypeptide of SEQ ID NO: 3 to reasonably conclude that Cover's (1992) protein, with its vacuolating toxin activity completely neutralized, anticipates the claimed polypeptide. That the completely neutralized (i.e., non-cytotoxic or less cytotoxic) 87 kDa or 100 kDa polypeptide of the

prior art containing the structurally identical 23 amino acid-long AFFTTVIIPAIVGGIATGTAVGT fragment is long enough to be intrinsically immunogenic is inherent from the teachings of Cover *et al.* (1992), since it is well known in the art that the smallest peptides which elicit antibodies that bind to the original full length protein are 6 amino acids in length. See the first sentence under 'Size of the Peptide' on page 76 of Harlow *et al.*

Furthermore, the term 'recombinant' or 'expressed from nucleotides of SEQ ID NO: 2' in the instant claims represents a process limitation in product claims. The prior art polypeptide anticipates the instantly claimed polypeptide, irrespective of how it is obtained. When claims are drawn to a product-by-process, claims are not limited to the manipulations of the recited step(s), but only the structure implied by the steps. MPEP § 2113 states:

[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process. *In re Thorpe*, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir. 1985) (citations omitted).

A product does not have to be made by the same process in order to be the same product, because a product is a product, no matter how it is claimed. Applicants have not shown that the alleged difference(s) in the process results in a product that is structurally different from the product of the prior art. In the instant case, Applicants have not shown that the underlying structure of the prior art polypeptide comprising the above-identified 23 amino acid-long N-terminal fragment differs from the instantly recited at least 5, 10, or 15 contiguous amino acid-containing polypeptide of the amino acid sequence SEQ ID NO: 3 comprising the same structurally identical N-terminal fragment.

Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 are anticipated by Cover *et al.* (1992). The reference of Harlow *et al.* is not used as a secondary reference in combination with Cover *et al.* ('132), but rather is used to show that every element of the claimed subject matter is disclosed by Cover *et al.* ('132) with the unrecited limitation(s) being inherent in view of what is known in the art as explained above. See *In re Samour* 197 USPQ 1 (CCPA 1978).

Remarks

- 20) Claims 40, 54, 61-65, 72-75, 82-86, 93 and 94 stand rejected.
- 21) Papers related to this application may be submitted to Group 1600, AU 1645 by facsimile transmission. Papers should be transmitted via the PTO Fax Center, which receives transmissions

24 hours a day and 7 days a week. The transmission of such papers by facsimile must conform with the notice published in the Official Gazette, 1096 OG 30, November 15, 1989. The RightFax number for submission of amendments, responses or papers is (703) 872-9306.

22) Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAG or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.Mov>. Should you have questions on access to the Private PAA system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).

23) Any inquiry concerning this communication or earlier communications from the Examiner should be directed to S. Devi, Ph.D., whose telephone number is (571) 272-0854. A message may be left on the Examiner's voice mail system. The Examiner can normally be reached on Monday to Friday from 7.15 a.m. to 4.15 p.m. except one day each bi-week, which would be disclosed on the Examiner's voice mail system.

If attempts to reach the Examiner by telephone are unsuccessful, the Examiner's supervisor, Lynette Smith, can be reached on (571) 272-0864.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (571) 272-1600.

November, 2004
